

Homework 1

Exercise 4.1 a) for this first one notice that the characteristic polynomial is simply $\lambda^2 - 1 = 0$ so the eigenvalues are $-1, 1$. with corresponding eigenvectors $v_1 = [1, 1]/\sqrt{2}, v_2 = [1, -1]/\sqrt{2}$. Constructing $V = [v_1, v_2]$ V is unitary so its inverse is its transpose V^T thus:

$$A = V \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} V^T \quad (1)$$

So:

$$e^{At} = V \begin{bmatrix} e^t & 0 \\ 0 & e^{-t} \end{bmatrix} V^T \quad (2)$$

$$= \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} e^t & 0 \\ 0 & e^{-t} \end{bmatrix} \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \quad (3)$$

$$= \frac{1}{2} \begin{bmatrix} e^{-t} + e^t & e^t - e^{-t} \\ e^t - e^{-t} & e^{-t} + e^t \end{bmatrix} \quad (4)$$

b) For this one we take the characteristic polynomial:

$$(1 - \lambda)(-\lambda) + \frac{1}{4} = \lambda^2 - \lambda + \frac{1}{4} \quad (5)$$

The roots of this are $\lambda = \frac{1}{2}$. I believe we will need to compute the generalized eigenvector. We compute the first one:

$$\begin{bmatrix} 1/2 & 1/2 \\ -1/2 & -1/2 \end{bmatrix} \quad (6)$$

The null space of this matrix is $v_1 = [1, -1]$. We compute the generalized eigenvector:

$$\frac{1}{2} \begin{bmatrix} 1 & 1 \\ -1 & -1 \end{bmatrix} v_2 = \begin{bmatrix} 1 \\ -1 \end{bmatrix} \quad (7)$$

The generalized eigenvector here is clearly just $v_2 = [1, 1]$ setting $V = [v_1, v_2]$ we compute $V^{-1} = \frac{1}{2} \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix}$

Then we can take the jordan normal form to be:

$$\begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} \frac{1}{2} & 1 \\ 0 & \frac{1}{2} \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix} \frac{1}{2} \quad (8)$$

We can then compute the matrix exponential to be:

$$\begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} e^{\frac{t}{2}} & e^{\frac{t}{2}}t \\ 0 & e^{\frac{t}{2}} \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix} \frac{1}{2} \quad (9)$$

Note that I just did the jordan form matrix exponential in my head (its just a polynomial). Combining all of these together we get:

$$\frac{e^{\frac{t}{2}}}{2} \begin{bmatrix} t+2 & t \\ -t & 2-t \end{bmatrix} \quad (10)$$

c) For this third and final problem! We compute the characterstic polynomial as:

$$(-\lambda)(-\rho - \lambda) + \omega^2 \quad (11)$$

$$= \lambda^2 + \rho\lambda + \omega^2 = 0 \quad (12)$$

$$\lambda = \frac{-\rho \pm \sqrt{\rho^2 - 4\omega^2}}{2} \quad (13)$$

Nowe we also compute the eigenvectors:

$$\begin{bmatrix} \frac{\rho \mp \sqrt{\rho^2 - 4\omega^2}}{2} & 1 \\ -\omega^2 & \frac{-\rho \mp \sqrt{\rho^2 - 4\omega^2}}{2} \end{bmatrix} \quad (14)$$

If you squint then we can see that the eigenvectors are

$$v_1 = \begin{bmatrix} \frac{-\rho \pm \sqrt{\rho^2 - 4\omega^2}}{2\omega^2} \\ 1 \end{bmatrix} \quad (15)$$

$$(16)$$

Because this exactly cancels out the bottom term.

Ok so now what is important is if $\rho^2 < 4\omega^2$ if that is the case then we will want to convert to the standard form for imaginary ones. Assume for the moment that $\rho^2 < 4\omega^2$

$$v_1 = \begin{bmatrix} \frac{-\rho + \sqrt{\rho^2 - 4\omega^2}}{2\omega^2} \\ 1 \end{bmatrix} \quad (17)$$

$$\begin{bmatrix} \frac{-\rho + i\sqrt{4\omega^2 - \rho^2}}{2\omega^2} \\ 1 \end{bmatrix} \quad (18)$$

$$(19)$$

for this we need to convert to the normal form by constructing $V = [\text{re}(v_1), \text{im}(v_1)] =$

$\begin{bmatrix} \frac{-\rho}{2\omega^2} \\ 1 \end{bmatrix} \begin{bmatrix} \frac{\sqrt{4\omega^2 - \rho^2}}{2\omega^2} \\ 0 \end{bmatrix}$. this matrix has inverse:

$$\begin{bmatrix} 0 & 1 \\ \frac{2\omega^2}{\sqrt{4\omega^2 - \rho^2}} & \frac{\rho}{\sqrt{4\omega^2 - \rho^2}} \end{bmatrix} \quad (20)$$

From here we know that the standard form then looks like:

$$V \begin{bmatrix} \frac{-\rho}{2} & -\frac{\sqrt{4\omega^2-\rho^2}}{2} \\ \frac{\sqrt{4\omega^2-\rho^2}}{2} & -\frac{\rho}{2} \end{bmatrix} V^{-1} \quad (21)$$

The exponential of this center matrix is

$$e^{-\rho t/2} \begin{bmatrix} \cos(\frac{\sqrt{4\omega^2-\rho^2}}{2}t) & -\sin(\frac{\sqrt{4\omega^2-\rho^2}}{2}t) \\ \sin(\frac{\sqrt{4\omega^2-\rho^2}}{2}t) & \cos(\frac{\sqrt{4\omega^2-\rho^2}}{2}t) \end{bmatrix} \quad (22)$$

So the general solution when $\rho^2 < 4\omega^2$ is:

$$e^{At} = e^{\frac{\rho t}{2}} V \begin{bmatrix} \cos(\frac{\sqrt{4\omega^2-\rho^2}}{2}t) & -\sin(\frac{\sqrt{4\omega^2-\rho^2}}{2}t) \\ \sin(\frac{\sqrt{4\omega^2-\rho^2}}{2}t) & \cos(\frac{\sqrt{4\omega^2-\rho^2}}{2}t) \end{bmatrix} V^{-1} \quad (23)$$

which simplifies to:

$$\begin{pmatrix} e^{-t\rho/2} \frac{\rho \sin\left(\frac{t\sqrt{-\rho^2+4\omega^2}}{2}\right) + \cos\left(\frac{t\sqrt{-\rho^2+4\omega^2}}{2}\right) \sqrt{-\rho^2+4\omega^2}}{\sqrt{-\rho^2+4\omega^2}} & e^{-\rho t/2} \frac{2 \sin\left(\frac{t\sqrt{-\rho^2+4\omega^2}}{2}\right)}{\sqrt{-\rho^2+4\omega^2}} \\ e^{-t\rho/2} \left(-\frac{2\omega^2 \sin\left(\frac{t\sqrt{-\rho^2+4\omega^2}}{2}\right)}{\sqrt{-\rho^2+4\omega^2}} \right) & e^{-t\rho/2} \frac{\cos\left(\frac{t\sqrt{-\rho^2+4\omega^2}}{2}\right) \sqrt{4\omega^2-\rho^2} - \rho \sin\left(\frac{t\sqrt{-\rho^2+4\omega^2}}{2}\right)}{\sqrt{4\omega^2-\rho^2}} \end{pmatrix} \quad (24)$$

In the case where $\rho^2 > 4\omega^2$ then we will have two eigenvalues and two linearly independent eigenvectors that are as stated before:

$$V = \begin{bmatrix} \frac{-\rho + \sqrt{\rho^2 - 4\omega^2}}{2\omega^2} & \frac{-\rho - \sqrt{\rho^2 - 4\omega^2}}{2\omega^2} \\ 1 & 1 \end{bmatrix} \quad (25)$$

This matrix has inverse:

$$V^{-1} = \frac{1}{2\sqrt{\rho^2 - 4\omega^2}} \begin{bmatrix} 2\omega^2 & \sqrt{\rho^2 - 4\omega^2} + \rho \\ -2\omega^2 & \sqrt{\rho^2 - 4\omega^2} - \rho \end{bmatrix} \quad (26)$$

So then the matrix exponential for this one is thus:

$$e^{At} = V \begin{bmatrix} e^{t\frac{-\rho + \sqrt{\rho^2 - 4\omega^2}}{2}} & 0 \\ 0 & e^{t\frac{-\rho - \sqrt{\rho^2 - 4\omega^2}}{2}} \end{bmatrix} V^{-1} \quad (27)$$

Which once simplified is:

$$\begin{pmatrix} \frac{e^{t\frac{-\rho + \sqrt{\rho^2 - 4\omega^2}}{2}} (-\rho + \sqrt{\rho^2 - 4\omega^2}) - e^{t\frac{-\rho - \sqrt{\rho^2 - 4\omega^2}}{2}} (-\rho - \sqrt{\rho^2 - 4\omega^2})}{2\sqrt{\rho^2 - 4\omega^2}} & \frac{-e^{t\frac{-\rho + \sqrt{\rho^2 - 4\omega^2}}{2}} + e^{t\frac{-\rho - \sqrt{\rho^2 - 4\omega^2}}{2}}}{\sqrt{\rho^2 - 4\omega^2}} \\ \frac{\omega^2 \left(-e^{t\frac{-\rho - \sqrt{\rho^2 - 4\omega^2}}{2}} + e^{t\frac{-\rho + \sqrt{\rho^2 - 4\omega^2}}{2}} \right)}{\sqrt{\rho^2 - 4\omega^2}} & \frac{e^{t\frac{-\rho + \sqrt{\rho^2 - 4\omega^2}}{2}} (\sqrt{\rho^2 - 4\omega^2} + \rho) + e^{t\frac{-\rho - \sqrt{\rho^2 - 4\omega^2}}{2}} (\sqrt{\rho^2 - 4\omega^2} - \rho)}{2\sqrt{\rho^2 - 4\omega^2}} \end{pmatrix} \quad (28)$$

Finally if $\rho^2 = 4\omega^2$. Then we will have to use the generalized eigenspace because we will have a degenerate eigenvalue at $-\rho/2$. to do this first note that one eigenvector remains the same $\begin{bmatrix} -\rho/(2\omega^2) \\ 1 \end{bmatrix}$ but from here notice that $\rho = 4\omega^2$. so this eigenvector is just $\begin{bmatrix} -2/\rho \\ 1 \end{bmatrix}$ We need to now find the generalized eigenvector. take:

$$\begin{bmatrix} \frac{\rho}{2} & 1 \\ -\omega^2 & \frac{-\rho}{2} \end{bmatrix} v = \begin{bmatrix} -2/\rho \\ 1 \end{bmatrix} \quad (29)$$

so clearly $v_2 = \begin{bmatrix} -4/\rho^2 \\ 0 \end{bmatrix}$. We can then almost construct the jordan decomposition. We take the matrix V:

$$V = \begin{bmatrix} -2/\rho & -4/\rho^2 \\ 1 & 0 \end{bmatrix} \quad (30)$$

From here the inverse of this is:

$$V^{-1} = \begin{bmatrix} 0 & 1 \\ -\rho^2/4 & -\rho/2 \end{bmatrix} \quad (31)$$

. So then the jordan decomposition is

$$A = V \begin{bmatrix} -\rho/2 & 1 \\ 0 & -\rho/2 \end{bmatrix} V^{-1} \quad (32)$$

The matrix exponential of the inside is just $e^{-\frac{\rho}{2}t} \begin{bmatrix} 1 & t \\ 0 & 1 \end{bmatrix}$. So then our final answer for this one is:

$$e^{At} = V \begin{bmatrix} e^{-\frac{\rho}{2}t} & e^{-\frac{\rho}{2}t}t \\ 0 & e^{-\frac{\rho}{2}t} \end{bmatrix} V^{-1} \quad (33)$$

which multiplied out is:

$$\frac{1}{4}e^{-\rho t/2} \begin{bmatrix} 2(\rho t + 2) & 4t \\ -\rho^2 t & -2(\rho t - 2) \end{bmatrix} \quad (34)$$

Exercise 4.2 writing $x_1 = u, x_2 = u'$ we get:

$$\begin{bmatrix} x'_1 \\ x'_2 \end{bmatrix} = \begin{bmatrix} x_2 \\ -2x_2 - x_1 \end{bmatrix} \quad (35)$$

$$= \begin{bmatrix} 0 & 1 \\ -1 & -2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \quad (36)$$

to solve this we need to compute the matrix exponential. For this I will first find the eigenvalues of A:

$$(\lambda)(\lambda + 2) + 1 = \lambda^2 + 2\lambda + 1 = (\lambda + 1)^2 \quad (37)$$

So we have a repeated eigenvalue at $\lambda = -1$ to find the first eigenvector take:

$$\begin{bmatrix} 1 & 1 \\ -1 & -1 \end{bmatrix} \quad (38)$$

Obviously the null space of this is $v_1 = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$. So that is our first eigenvector. We need to solve for the second generalized one

$$\begin{bmatrix} 1 & 1 \\ -1 & -1 \end{bmatrix} v_2 = \begin{bmatrix} 1 \\ -1 \end{bmatrix} \quad (39)$$

Once again the solution here is clear just take $v_2 = \frac{1}{2} \begin{bmatrix} 1 \\ 1 \end{bmatrix}$

So the transformation vector is $[v_1, v_2]$ The inverse of this is:

$$\begin{bmatrix} 1 & 1/2 \\ -1 & 1/2 \end{bmatrix}^{-1} = \begin{bmatrix} 1/2 & -1/2 \\ 1 & 1 \end{bmatrix} \quad (40)$$

So our jordan normal form is:

$$\begin{bmatrix} 1 & 1/2 \\ -1 & 1/2 \end{bmatrix} \begin{bmatrix} -1 & 1 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} 1/2 & -1/2 \\ 1 & 1 \end{bmatrix} \quad (41)$$

From this we can apply the matrix exponential:

$$e^{At} = \begin{bmatrix} 1 & 1/2 \\ -1 & 1/2 \end{bmatrix} e^{Jt} \begin{bmatrix} 1/2 & -1/2 \\ 1 & 1 \end{bmatrix} \quad (42)$$

from here we know that $e^{Jt} = e^{\Lambda t} (I + \begin{bmatrix} 0 & t \\ 0 & 0 \end{bmatrix}) = \begin{bmatrix} e^{-t} & te^{-t} \\ 0 & e^{-t} \end{bmatrix}$ So the general solution with initial data $u(0) = u_0, u'(0) = u_1$ is (setting $x_0 = \begin{bmatrix} u_0 \\ u_1 \end{bmatrix}$)

$$e^{At} = \begin{bmatrix} 1 & 1/2 \\ -1 & 1/2 \end{bmatrix} \begin{bmatrix} e^{-t} & te^{-t} \\ 0 & e^{-t} \end{bmatrix} \begin{bmatrix} 1/2 & -1/2 \\ 1 & 1 \end{bmatrix} \quad (43)$$

$$x(t) = \begin{bmatrix} 1 & 1/2 \\ -1 & 1/2 \end{bmatrix} \begin{bmatrix} e^{-t} & te^{-t} \\ 0 & e^{-t} \end{bmatrix} \begin{bmatrix} 1/2 & -1/2 \\ 1 & 1 \end{bmatrix} x_0 \quad (44)$$

$$= \begin{bmatrix} e^{-t} + te^{-t} & te^{-t} \\ -te^{-t} & e^{-t} - te^{-t} \end{bmatrix} x_0 \quad (45)$$

$$= \begin{bmatrix} u_0(e^{-t} + te^{-t}) + u_1 te^{-t} \\ u_0(-te^{-t}) + u_1(e^{-t} - te^{-t}) \end{bmatrix} \quad (46)$$

so since $x_1 = u$ we have that:

$$u = u_0(e^{-t} + te^{-t}) + u_1 te^{-t} \quad (47)$$

Exercise 4.3 To prove this we first solve for either eigenvalue:

$$\lambda_1 + \lambda_2 = T \quad (48)$$

$$\lambda_1 \lambda_2 = D \quad (49)$$

$$\lambda_2 = T - \lambda_1 \quad (50)$$

$$\lambda_1(T - \lambda_1) = D \quad (51)$$

$$\lambda_1^2 - T\lambda_1 + D = 0 \quad (52)$$

$$\lambda_1 = \frac{T \pm \sqrt{T^2 - 4D}}{2} \quad (53)$$

From here notice that $\lambda_2 = T - \lambda_1 = \frac{T \mp \sqrt{T^2 - 4D}}{2}$. So the two solutions are just given by:

$$\lambda_1 = \frac{T + \sqrt{T^2 - 4D}}{2} \lambda_2 = \frac{T - \sqrt{T^2 - 4D}}{2} \quad (54)$$

When graphed on desmos we get

Where the trace T is the x axis and the determinant D is the y axis. Here I will label each region:

I use x and y here, but just mentally remember $x = \text{Trace}$ $y = \text{Determinant}$

- for $x < 0, 0 < y \leq \frac{x^2}{4}$ (the lower blue region) we have stable nodes (both eigenvalues are real and negative)
- for $x > 0, 0 < y \leq \frac{x^2}{4}$ (the lower red region) we have unstable nodes (both eigenvalues are real and positive)
- for $y \leq 0$ and not including $(x, y) = (0, 0)$ (the orange region) we have saddle nodes (both eigenvalues are real, one is negative and one is positive and either could potentially be zero but not both)
- for $x = 0, y \geq 0$ (the purple line) we have the center nodes where both eigenvalues have zero real part.
- for $x < 0, y > \frac{x^2}{4}$ (the upper blue region) we have stable spirals (both eigenvalues have negative real part and some imaginary part)

- for $x > 0, y > \frac{x^2}{4}$ (the upper red region) we have unstable spirals (both eigenvalues have positive real part and some imaginary part)
